

# Children Screen Time Behavior Analysis (ScreenSense)

This project focuses on analyzing children's screen time behavior using interactive dashboards. The goal is to identify usage patterns, demographic differences, and behavioral factors influencing screen exposure.

## Dashboard Structure

The dashboard is divided into three main pages: 1. Overview of Screen Usage 2. Demographic & Segment Analysis 3. Cohort & Behavioral Insights

### Page 1: Screen Usage Overview

This page introduces the dataset and highlights overall screen behavior. Key insights include average screen time, device usage, and age distribution. Visuals: - KPI Cards (Average Screen Time, Exceeded Limit %, Device Usage) - Histogram for screen time distribution - Bar chart for device usage - Age band distribution chart

### Page 2: Demographic Analysis

This page explores how screen time varies across different groups. Insights: - Screen time increases with age - Minor differences across gender - Urban children slightly higher usage - Older children prefer mobile devices Visuals: - Bar charts and box plots - Stacked charts for device usage

### Page 3: Cohort & Behavioral Insights

This page identifies high-risk groups and behavioral drivers. Insights: - Older children using mobile devices show highest usage - Recreational usage leads to increased screen time - Portable devices exceed recommended limits more Visuals: - Heatmaps - Scatter plots - Stacked bar charts

## Global Filters

The dashboard includes interactive filters: - Age Band - Gender - Urban/Rural - Device Type - Usage Level

## Conclusion

This project provides a data-driven approach to understanding children's screen behavior. It helps identify high-risk groups and supports better decision-making for parents and educators.
